### Solution/Mixtures of Native & Mass-Labelled Hexabromocyclododecane Isomers

Hexabromocyclododecane (HBCD) is a widely used brominated flame retardant (BFR) that is primarily utilized as an additive in textiles and extruded polystyrene foams. Commercial HBCD is a mixture consisting mainly of three diastereomeric pairs of enantiomers; alpha( $\alpha$ )-, beta( $\beta$ )- and gamma( $\gamma$ )-HBCD, however **Wellington** currently offers all 10 possible isomers of HBCD (alpha( $\alpha$ )-, beta( $\beta$ )-, gamma( $\gamma$ )-, delta( $\delta$ )-, epsilon( $\epsilon$ ), zeta( $\zeta$ )-, eta( $\eta$ )-, theta( $\theta$ )-, iota( $\iota$ )-, and kappa( $\kappa$ )-HBCD) as individual reference standards.

In response to recent customer requests, **Wellington** has prepared native and mass-labelled solution/mixtures of the major HBCD isomers (alpha, beta, and gamma), with product codes of HBCD-MXA and MHBCD-MXA respectively.
